

## **CYCLE DE CONFÉRENCES DE CHIMIE**

*Avec le concours de : Manufacture Française des Pneumatiques MICHELIN  
Ecole Nationale Supérieure de Chimie de Clermont-Ferrand  
Institut de Chimie de Clermont-Ferrand (ICCF UMR 6296)  
U.F.R. S.T. Département de Chimie*

---

### **Jeudi 24 mars à 16 h**

Amphi Rémy

### **Stéphane CAMPIDELLI**

*CEA Saclay, IRAMIS, Laboratoire d'Innovation en Chimie des Surfaces et Nanoscience,  
Gif sur Yvette*

## **FUNCTIONALIZATION OF CARBON NANOTUBES AND GRAPHENE FOR OPTICS AND ELECTROCATALYSIS**

The fabrication of tailor-made functional hybrid materials that preserves and combines the properties of their building blocks is a central issue of nanosciences. In particular, the development of efficient techniques for the functionalization of carbon-based nanomaterials (carbon nanotubes and graphene) preserving their exceptional quality, while robustly enriching their functionalities (in particular their optical properties) is highly desirable for demanding applications.

It is well established that the covalent grafting of molecules on carbon nanotubes and graphene gives rise to robust conjugates since the addends are linked through covalent bonds. However, the transformation of carbon atoms hybridized  $sp^2$  into  $sp^3$  in the conjugated carbon framework induces a sizeable loss of their electronic properties.[1] On the contrary, the non-covalent functionalization permits to better preserve the electronic properties of the nano-objects.[2] So, for a number of applications, the non-covalent functionalization should be preferred. Nevertheless, this approach suffers from a major drawback which is the lack of stability of the resulting assemblies.

I will describe the general approach that we developed in our group for functionalizing nanotubes and graphene.[3] This method is based on the templated-polymerization of organic molecules around nanotubes or graphene; it combines most advantages of both covalent and non-covalent methods without their principal drawbacks. This approach permits to obtain hybrid materials exhibiting high stability while preserving the integrity of the  $\pi$ -conjugated system responsible for their optical and electrical properties.
